## 1-(3,4-Dimethoxyphenyl)-3-phenylprop-2-en-1-one

Basavaiah Umesha,<sup>a</sup> Yeriur Basavaiah Basavaraju,<sup>a</sup> Manpreet Kaur,<sup>a</sup> Hemmige S. Yathirajan<sup>a</sup> and Jerry P. Jasinski<sup>b\*</sup><sup>a</sup>Department of Studies in Chemistry, University of Mysore, Manasagangotri, Mysore 570 006, India, and <sup>b</sup>Department of Chemistry, Keene State College, 229 Main Street, Keene, NH 03435-2001, USA  
Correspondence e-mail: [jjasinski@keene.edu](mailto:jjasinski@keene.edu)

Received 14 February 2014; accepted 18 February 2014

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.051;  $wR$  factor = 0.152; data-to-parameter ratio = 14.5.

In the title compound,  $\text{C}_{17}\text{H}_{16}\text{O}_3$ , the dihedral angle between the mean planes of the benzene rings is  $57.1(1)^\circ$ . The mean plane of the ketone group is twisted by  $10.0(5)^\circ$  from that of the dimethoxyphenyl ring. The two dimethoxyphenyl groups are twisted slightly from the mean plane of the phenyl ring, with  $\text{C}-\text{O}-\text{C}-\text{C}$  torsion angles of  $6.4(2)$  and  $-7.9(2)^\circ$  [r.m.s. deviations =  $0.15(3)$  and  $0.18(3)$  Å for the two methoxy C atoms]. In the crystal, weak centroid-centroid  $\pi-\pi$  stacking interactions, with intercentroid distances of  $3.8939(11)$  and  $3.9430(10)$  Å are observed.

**S1. Comment**

1-(3,4-dimethoxyphenyl)-3-phenylprop-2-en-1-one is an intermediate for the synthesis of pyrazole derivatives, podophyllotoxin and its derivatives which have pharmaceutical applications (Basavaraju & Devaraju, 2002). More generally, chalcone derivatives have many applications in biological studies (Choudhary & Juyal, 2011). Chalcone derivatives are notable for their excellent blue-light transmittance and good crystallizability (Uchida *et al.*, 1998). In continuation of our work on chalcone derivatives, this paper reports the crystal structure of the title compound  $C_{17}H_{16}O_3$ .

In the title compound the dihedral angle between the mean planes of the two phenyl rings is  $57.1 (1)^\circ$  (Fig. 1). The mean plane of the ketone group (C2/C1/O1/C10) is twisted by  $10.0 (5)^\circ$  from that of the dimethoxyphenyl ring. The two dimethoxyphenyl groups are twisted slightly from the mean plane of the phenyl ring with torsion angles of  $6.4 (2)^\circ$  (C16/O2/C14/C15) and  $-7.9 (2)^\circ$  (C17/O3/C13/C12) [r.m.s. deviations =  $0.15 (3)$  and  $0.18 (3)$  Å for the two methoxy C atoms]. Bond lengths are in normal ranges (Allen *et al.*, 1987). In the crystal, while no classical hydrogen bonds are observed, weak Cg1–Cg1 and Cg2–Cg2  $\pi$ – $\pi$  stacking interactions with intercentroid distances of  $3.8939 (11)$  Å and  $3.9430 (10)$  Å (Symmetry operations  $1 - x, 2 - y, 1 - z$  and  $-x, 1 - y, 2 - z$ ; Cg1 and Cg2 are the centroids of the phenyl rings, C4–C9 and C10–C15) between the phenyl rings are observed and contribute to the crystal packing.

**S2. Experimental**

1-(3,4-Dimethoxyphenyl)ethanone (1.80 g 10 mmol) and benzaldehyde (1.02 ml, 10 mmol) were stirred in water (40 ml) and ethanol (20 ml) mixture in the presence of sodium hydroxide (0.8 g, 20 mmol) at 288–303 K for 4 h (Fig. 2). The reaction mixture was kept overnight in an ice bath. The precipitated products were filtered and recrystallized from methanol. Anal. calcd. for  $C_{17}H_{16}O_3$ : C, 76.10; H, 6.01. Found: C, 76.04; H, 5.89% (Umesha & Basavaraju, 2013).

**S3. Refinement**

All of the H atoms were placed in their calculated positions and then refined using the riding model with C—H lengths of  $0.95$  Å (CH) or  $0.98$  Å ( $CH_3$ ). Isotropic displacement parameters for these atoms were set to 1.2 (CH) or 1.5 ( $CH_3$ ) times  $U_{eq}$  of the parent atom. Idealized Me were refined as a rotating group.

Extinction coefficient: 0.016 (3)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
